

BILIMAI • TASHKENT • 2026

BilimAI

AI that reads, checks and grades students' written work — so teachers can teach.

Investment proposal for government-sponsored investors

THE PROBLEM

Teachers spend their evenings marking, not teaching

41 h

average teacher working week across OECD systems — up from 38.8 h in 2018

~half

of that week is spent on tasks other than teaching — marking, admin, paperwork

16 : 6

education systems where marking time rose since 2018, versus only 6 where it fell

Teacher working hours per week (term time)

Singapore teachers alone report 6.4 h of marking every week.

BilimAI — a marking assistant for every teacher

Reads

Understands handwritten and typed assignments in Uzbek and Russian — essays, short answers, problem sets.

Checks

Finds errors and measures the work against the national curriculum rubric — the same criteria every time.

Grades

Returns a consistent draft grade in seconds, not evenings — for a whole class at once.

Gives feedback

Writes personal, constructive feedback for each student, ready for the teacher to approve.

The teacher stays in control. Every grade and every comment is a draft until the teacher approves it.

From a pile of notebooks to approved feedback

Minutes per class, not evenings. And the same guardrail China's Ministry of Education wrote into its 2025 rules: AI assists — the teacher decides.

PROVEN ABROAD

China already did this — at national scale

Share of Chinese schools in the AI essay-grading trial

~60,000 schools • 120M+ people

92%

of the AI's grades matched the human teacher's score in the national trial

130M+

teachers and students use iFlytek's AI education tools in 50,000+ Chinese schools

National policy since May 2025. China's Ministry of Education made AI literacy part of the school curriculum and issued rules for AI use in classrooms.

Personalised learning at scale. Squirrel AI's adaptive system has taught 24M+ students across 300+ cities — named a TIME Best Invention 2025.

Automated feedback measurably improves writing

Effect of automated writing feedback on writing quality (Hedges' g)

Both are peer-reviewed meta-analyses. In education research, $g \geq 0.55$ is a medium-to-large effect.

As accurate as humans

In the Hewlett Foundation's ASAP benchmark, automated essay scoring matched human-to-human agreement on most prompt types.

Feedback arrives while it matters

Students get feedback the same day they write — not two weeks later when the class has moved on.

Consistent and fair

The same rubric, applied the same way, to every student — no end-of-stack fatigue.

The impact here would be enormous

564,900

school teachers (2024/25)

6.5M

students in 10,522 schools

73%

of schools run multiple shifts

+43%

more teachers than 2015 — and still short

Marking hours per teacher per week

Illustrative model: 75% marking-time reduction on a 5 h/week baseline (regional surveys report 4.6–6.4 h).

≈ 2 million

teacher-hours handed back every single week, nationwide — time for lesson quality, struggling students, and teachers' own lives.

Aligned with the state's own strategy

DECREE DP-6079

Digital Uzbekistan 2030

Presidential Decree DP-6079 (2020) names education a priority sector for digital transformation — 1,627 projects nationwide.

RESOLUTION PQ-358

National AI Strategy 2030

Presidential Resolution PQ-358 (Oct 2024) targets a \$1.5B domestic AI market by 2030 — with education a named priority for AI adoption.

CHINA MOE MODEL

The proven playbook

China moved from trials (2018) to national AI-in-education policy (2025). BilimAI brings the same playbook home — with teachers in charge.

A state-backed BilimAI pilot is not a bet against policy — it executes it.

AI in education is growing 5× in six years

Global AI-in-education market, USD billions

2025–2029 interpolated at the reported ~33% CAGR between the published 2024 and 2030 figures.

\$32.3B

projected global AI-education market by 2030
(Grand View Research)

\$1.5B

Uzbekistan's own 2030 target for domestic AI
products and services

First-mover in Uzbek-language grading — and a
bridge to 80M+ Turkic-language speakers across
Central Asia.

Pilot first. Prove it. Then scale.

PHASE 1 • 2026–27

Pilot

100 schools in 1–2 regions. Uzbek + Russian language models trained on curriculum rubrics. Teachers co-design the feedback style. Independent evaluation of accuracy vs teacher grades.

PHASE 2 • 2027–28

Regional scale

1,000 schools. Integration with national e-education platforms. Teacher-training programme. Published accuracy and time-saved metrics.

PHASE 3 • 2028–30

National + export

Nationwide rollout across 10,000+ schools. Export the Uzbek/Turkic-language engine to Central Asian neighbours.

Every phase gates on published evidence — the pilot's independent evaluation decides the scale-up.

What we need from you

Pilot funding

Finance the 100-school pilot: model development for Uzbek and Russian, teacher training, and an independent accuracy evaluation.

Access & partnership

A partnership with the Ministry of Preschool and School Education: pilot schools, official curriculum rubrics, and anonymised sample work.

Trust & oversight

Joint governance: student-data protection under Uzbek law, teacher-in-the-loop as a hard rule, and public reporting of results.

Give teachers back their time.

China proved automated grading works at the scale of 60,000 schools. The research says it helps students write better. Uzbekistan's own strategy calls for it. BilimAI is how it happens here.
